## Nebraska Wastewater Surveillance for SARS-CoV-2 Facility Report for Grand Island WWTP

Report for Week Ending: 9/24/22 (Week 39)

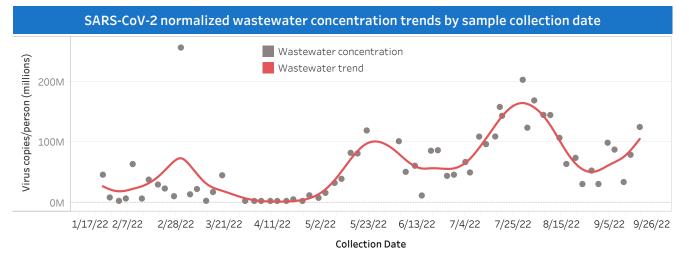

SARS-CoV-2 virus concentration in wastewater

Sample collection date: 9/18/22 Result: Detected Raw Concentration: 143,035 copies/L Normalized concentration: 124.9M copies/person

Normalized concentration is the raw conentration adjusted for sewage flow rate and population, in million copies per person.

| Current virus levels in wastewater | 15 day percent change  |
|------------------------------------|------------------------|
| <b>Very High (80-100%)</b>         | Increasing             |
| as of 9/18/22                      | from 9/3/22 to 9/18/22 |

Current virus levels is based on a percentile that shows whether virus levels at a site are currently higher or lower than past historical levels at the same site. Very High: 80-100%, High: 60-<80%, Moderate: 40-<60%, Low: 20-<40%, Very Low: <20%. Percent change is the modeled rate of change over last 15 days. Categories include: Increasing (10% or higher); Stable (10% to -10%); Decreasing (-10% or lower)

The grey dots represent SARS-CoV-2 normalized wastewater concentration for each sample collection date. Wastewater levels shown in red line are simple smoothing splines to help interpret trends over time. They do not indicate a specific or actionable values.
